Lab 4 Vibe Coding — Cleaned Conversation Transcript

Profanity has been omitted. The technical meaning and sequence of the conversation have been retained.

User: [Shared the GitHub repository] WellWeAreHere/36_dinoRun:
Implementation of Dino Run in Pygame.

Assistant: You shared the Dino Run repository and the Lab 4 Vibe Coding handout. The handout requires cloning/forking the assigned repository, recording a 10-second video before changes, fixing the code and implementing README features, recording another 10-second video, pushing the code to your own repository, and submitting both videos, updated code, and exported chat history.

User: How do I install the game?

Assistant: On Windows, open CMD and run:

```
git clone https://github.com/WellWeAreHere/36_dinoRun.git
cd 36_dinoRun
py -m pip install pygame
dir
```

Look for the main Python file (for example, main.py or dinoRun.py) and run it with py filename.py. Record the 10-second before video once the game runs.

User: I recorded the 10-second video. Now make the changes.

Assistant: The planned changes were: 1. Fix the high-score bug. 2. Change the dino's colour while jumping. 3. Add a reward when an obstacle is cleared. 4. Enable double jumping.

User: Give me all the code in one text. I don't want to replace individual sections.

Assistant: Provided a complete replacement game.py implementing the four changes, with a Pygame game loop, dino, obstacles, score, high-score persistence, jump colour, reward popup, and double jump. The user was instructed to save it as game.py and run:

```
py game.py
```

The assistant advised testing the high score, colour change, reward popup, and double jump before recording the after video.

User: It is working. What should I do now?

Assistant: Complete the remaining deliverables: - Record a 10-second after video showing the modified game. - Keep the updated code and any assets needed to run it. - Export the AI chat history as a PDF. - Push the code to the user's own GitHub repository. - Organize the files in the Lab-4 submission folder.

Suggested folder structure:

```
Lab-4/  
├── before.mp4  
├── after.mp4  
├── game.py  
└── chat_history.pdf
```

User: The Git remote shows
origin https://github.com/WellWeAreHere/36_dinoRun.git (fetch).

Assistant: Explained that the remote should point to the user's own repository, not an upstream repository they do not have permission to modify. Suggested checking git remote -v, setting the origin to the user's fork if needed, then running:

```
git add .  
git commit -m "Complete Dino Run Lab 4"  
git push -u origin HEAD
```

User: WellWeAreHere is my username.

Assistant: Explained that if WellWeAreHere/36_dinoRun is already the user's own repository and the changes have been pushed successfully, there is no need to fork it again. If it is the original assignment repository, a separate fork or repository is needed.

User: I am done. What next?

Assistant: Record the after video, export the chat history, and organize the videos, code, and PDF in the Lab-4 folder. Include any additional files required to run the game.

User: Do I need to submit the GitHub repository too?

Assistant: The handout explicitly requires pushing the code to a personal GitHub repository. It does not explicitly say the URL must be uploaded separately, but submitting the repository link alongside the other deliverables is sensible. Ensure the repository contains the updated code and is accessible to the instructor.

User: [Shared a screenshot of GitHub's "Create a new fork" page, showing "No available destinations to fork this repository."]

Assistant: Explained that GitHub does not allow a repository to be forked into the same account when that account already owns it. If the existing repository is the user's own repository and the changes are pushed, another fork is unnecessary. If it is the original assignment

repository, a separate repository is needed. Suggested checking that the updated game.py is visible on GitHub.

User: I forgot to record the before video.

Assistant: Explained that the original version may be recoverable from Git history. Suggested checking commits and, if the latest commit contains the modifications, creating a separate worktree for the previous version:

```
git log --oneline -5
git worktree add ..\dino-original HEAD~1
cd ..\dino-original
dir
```

Then run the original game's Python file (for example, py game.py) and record it. Clarified that this would be a recreation of the before video, not a recording made before changes, and advised not to misrepresent it as an original recording. If there are multiple commits, inspect the log to choose the correct version.
